# South Capitol Street Corridor

## Washington, DC

Design of the gateway corridor and parkland associated with the new South Capitol Street Bridge over the Anacostia River. Consisting of circulation ovals, multi-use trails, waterfront promenades, enhanced habitat areas, and bio-stormwater retention, the project functions as an open space monument to Frederick Douglass, punctuated by the multi-arch bridge structure, the first of its kind in D.C. The design-build project is currently under construction. *Ignacio performed this work with a previous firm.*

The Bridge arches echo the hillside topography of Anacostia in celebration of Frederick Douglass's historic place of residence.
